

Pressure Care

A pressure injury is localized damaged to the skin and underlying soft tissue. The injury occurs as a result of intense or prolonged pressure or pressure in combination with shear. There are 4 stages to a pressure injury.

Stage 1: Intact skin with non-blanchable redness of a localized area

Stage 2: Shallow ulcer with a red wound bed. May also be blister like

Stage 3: Full thickness tissue loss. Exudate may be present. Depth can vary by anatomical location

Stage 4: Full thickness tissue loss with exposed bone, tendon or muscle. Exudate may be present. Exposed bone, muscle exposed

Assistive Technology to assist with decreasing the risk of pressure areas

- **Bedroom Equipment-** static pressure relieving mattress, alternating pressure mattress, sheepskin heel/elbow protectors, heel float, positioning products, gel products
- **Seating-** pressure reducing cushion for lounge chair, car seat
- **Toileting-** padded toilet seat covers, pressure reducing seats for commode
- **Everyday Aids-** skin protectors, adjustable sheepskin footwear
- **Skin Integrity-** specialized skin care range for showering, skin barriers, lotions
